

Who's watching the test?

AI proctoring in university exams and HackerRank job assessments

[NAME 1] · [NAME 2] · [NAME 3] · [NAME 4]

01 · HOW IT WORKS

Computer vision and behavioural models score the session. Nothing here proves cheating. It produces suspicion, and a human decides.

Why this counts as AI

- Performance**: catch cheating, spare the honest
- Environment**: one candidate, one room, one screen
- Actuators**: flags, screenshots, an integrity score
- Sensors**: camera, screen, keystrokes, browser

Percepts in, actions out. It keeps state and adapts: one flag makes it watch harder.

Three levels of lockdown

- 1 Secure.** Rules only. Full screen, no copy-paste, one monitor.
 - 2 Proctor.** AI added. Webcam, screenshots, gaze, plagiarism scoring.
 - 3 Desktop app.** Operating system level lockdown.
- Level 1 is a rule. Level 2 is a model. Only level 2 can be wrong about you.

What happens when you are flagged

02 Ethical issues

- Bias you cannot prove**
Face detection struggles with darker skin. Students are locked out, lose exam time, and cannot prove it.
- Punished for moving**
Normal means a still, neutral body. Movement reads as suspicion, and so does the accommodation.
- Flagged, with no appeal**
The system produces suspicion, not proof. A human signs it off seeing only the flag. Nobody is told.
- Your bedroom is an exam hall**
Room scans put a university inside a student's home. A US federal court called that an unreasonable search.
- Biometrics that get leaked**
They take face geometry, eye movement, keystrokes. You can reset a password, not your face.
- Consent you cannot refuse**
Saying no means failing the exam or losing the job. The evidence is the vendor's property.

03 Current responses

- The EU AI Act names it**
The AI Act rates proctoring high risk and bans emotion recognition. The deadline slipped sixteen months.
- The UK audited, politely**
ICO audit: some tools let recruiters filter by protected characteristics, others guessed ethnicity.
- Vendors marked their own work**
Vendors improved detection and added human review. HackerRank reports a plagiarism model at 93% accuracy.
- A regulator fined a university**
Italy fined Bocconi University 200,000 euro for Respondus, and banned biometric processing.
- Institutions walked away**
Campaigns worked. Illinois dropped Proctorio over accessibility, Colorado Boulder rejected it campuswide.
- Employers went back in person**
Facing AI-assisted cheating, major firms brought interviews back in. Others now let candidates use AI.

No regulator. No appeal. No notice.

04 What next?

- THE EXITS**
 - Audit & appeal**: Independent audits of the tools, and a candidate's right to see and challenge a flag.
 - Fix the test, not the watching**: Assessments that are hard to game by design, so surveillance isn't the only defence.

05 · THE DEBATE

So should we use it? ⚖️

YES: it protects fair testing

Cheats beat honest candidates when no one checks. Remote testing opened exams and jobs to millions: it only works if results can be trusted.

☐☐ worries about the cheats it MISSES

NO: it fails at both ends

It accuses the honest, discriminates by skin tone, and still misses the tools built to beat it. Watching harder hasn't worked.

☐☐ worries about the honest it FLAGS

Our group is split. Come and argue with us.
