

Who's watching the test?

AI proctoring in university exams and HackerRank job assessments

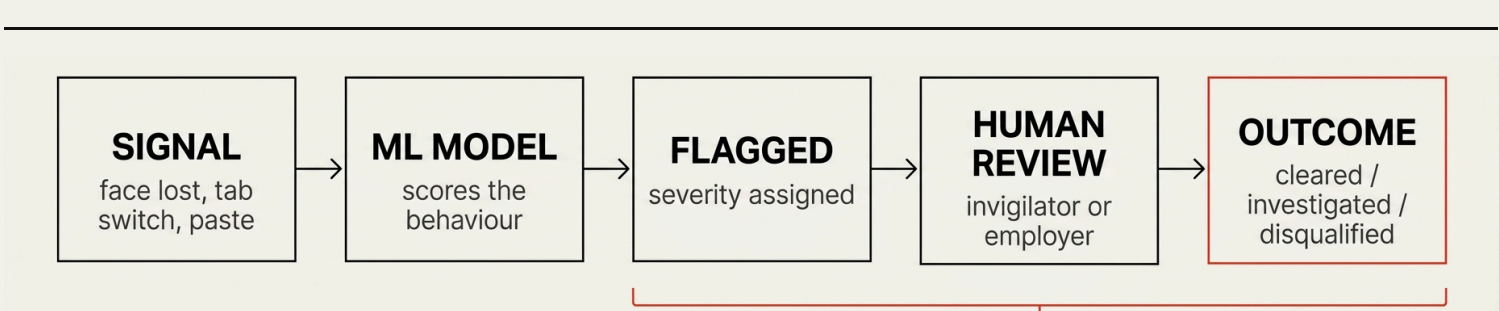

[NAME 1] · [NAME 2] · [NAME 3] · [NAME 4]

01 · HOW IT WORKS

Computer vision and machine learning flag "suspicious" behaviour. A human decides.

What happens when you are flagged

The candidate usually never sees the footage, the reason, or a route to appeal.

"Face not found. Room too dark."

The errors that kept a student out of her exam — VU Amsterdam, 2022.

02 Ethical issues

- Privacy: US court ruled an exam room scan unconstitutional (Ogletree, 2022)
- Bias: face detection repeatedly failed a student with dark skin (VU Amsterdam)
- Consent: refusing means failing the exam or losing the job

03 Current responses

- EU AI Act: exam proctoring and hiring AI are "high-risk"
- UK ICO audited AI recruitment tools (2024)
- Vendors publish their own bias audits — not independent

04 What next?

- Cheating tools like Interview Coder claim to be invisible
- Independent audits and a right to appeal
- Better tests instead of more surveillance?

		FLAGGED	NOT FLAGGED
CHEATING	CAUGHT		MISSED
	HONEST	FALSE POSITIVE	CORRECT

Lowering the threshold catches more cheating — and accuses more honest students.

05 · THE DEBATE

So should we use it?

YES — it protects fair testing

Without checks, students and candidates who cheat beat honest ones. Remote testing gave millions access to exams and jobs — it only works if results can be trusted.

NO — it fails at both ends

It flags honest people, discriminates by skin tone, and still misses the tools built to beat it. More surveillance has not meant less cheating.

Our group is split on this — come and argue with us.
